### Introduction

FM64 is a set of custom oscillator variations for KORG prologue, minilogue XD and NTS-1 synthesizers that reproduces Yamaha DX / TX series 6-operator FM synthesis. The oscillator must be prepopulated with the Yamaha DX7 voice banks of your choice using the online constructor (see in the next section) before uploading to the synthesizer. For information on how to upload a custom oscillator to the synthesizer and how to activate it, please refer to the Synthesizer Owner's Manual and Sound Librarian Owner's Manual for your KORG synthesizer model.

### Quick start

The raw oscillator file has no banks inside and won't produce any sound. To make the oscillator work you must first populate it with the voice banks.

#### Obtaining the oscillator with custom voices

- 1. Navigate to the online constructor web page.
- 2. Select your KORG synthesizer model to define the target format of the oscillator file.
- 3. Locate the FM64 oscillator row by the column NAME
- 4. Check the SIZE column of this row, the last multiplier is the maximum number of voice banks this oscillator can contain.
- 5. Click the **Upload** button located in the **CUSTOM DATA** column of this row.
- 6. In the file open dialog select one to several (up to obtained in step 4) voice bank files.
- 7. Check the CUSTOM NAME cell in this row. This name is generated from the names of the uploaded banks and you can alter it now. This name will be displayed by the Librarian and your synthesizer.
- 8. Click the **Download** button located in the **CUSTOM UNIT** cell of this row.
- 9. Now you can upload the oscillator file to your KORG synthesizer with the Librarian application.

### Changing oscillator custom parameters

- 1. Proceed with steps 1 thru 7 of the previous section.
- Click on one of the highlighted values in the columns SHAPE, ALT, PARAM1, PARAM
   PARAM 3, PARAM 4, PARAM 5, PARAM 6 of this row.
- 3. From the popup menu select the desired custom parameter for the parameter selected in step 2. You need to scroll with the mouse wheel to reach all of the available custom parameters.
- 4. Repeat steps 2 and 3 for other oscillator parameters you wish to reassign.
- 5. Proceed with steps 8 and 9 of the previous section.

### **Features**

#### Oscillator variations

Custom oscillators are limited both in space and performance so it is not possible to fit all the features in the single oscillator. For the enhanced creativity there are several precompiled oscillator variations with different sets of features. The following table summarizes differences between variations:

Feature \ Oscillator	FM64	FM65	FM66	FM67	FM68	FM69
Preset algorithm count	85	85	85	85	85	85
User algorithm count	-	16	-	-	-	-
Voice bank count	5	5	4	3	2	5
Feedback count	1	2	1	1	1	1
Waveform count	1	1	8	16	1	1
Custom parameters count	127	130	137	137	127	127
Waveform customization			+	+		
Chromatic mode	+	+	+	+	+	
Kit mode	+	+	+	+	+	+
AMP LUT depth x width (bits)	11 x 16	11 x 16	11 x 16	11 x 16	13 x 16	11 x 16
Mixing quality (bits)	32	16	32	32	32	32

## Velocity

Velocity is not passed natively to the custom oscillators. To control the voice velocity, the custom parameter is used. When Velocity is assigned to the Shape or Alt (Shift + Shape), the enhanced 10-bit precision will be used. By default velocity is assigned to the Shape knob. When Velocity is assigned to the oscillator parameter knob, it will have 7-bit precision and be limited to 100, similar to the first generation of Yamaha DX / TX series synthesizers.

#### Share and Alt assign

Shape Assign and Alt Assign custom parameters allows to assign any of the existing custom parameters to the Shape or Alt (Shift + Shape) respectively. Custom parameter numbers are specified in the <u>Custom parameters list</u>. Since Shape and Alt (Shift + Shape) are unipolar, positive custom parameter number only affects bipolar custom parameter value in a positive range and negative custom parameter number affects bipolar custom parameter in a negative range.

#### Chromatic and kit modes

There are two modes available in the oscillators depending on the variation. The chromatic mode is a standard mode for the keyboard instrument when keys controls the pitch of the oscillator, i.e. plays notes of the same voice. The kit mode is normally for drums, when each key plays different voice.

#### Banks and voices

For negative voices, banks are wrapped backwards, starting from the maximum available bank for the current oscillator variation regardless of the number of banks that uploaded into this oscillator in the online constructor. In the table below you can find the actual bank and voice mapping:

Banks \ Voice	-9665	-6433	-321	0	132	33 63	6496
1	Bank 1	Bank 1	Bank 1	Kit mode	Bank 1	Bank 1	Bank 1
2	Bank 2	Bank 1	Bank 2	Kit mode	Bank 1	Bank 2	Bank 1
3	Bank 1	Bank 2	Bank 3	Kit mode	Bank 1	Bank 2	Bank 3
4	Bank 2	Bank 3	Bank 4	Kit mode	Bank 1	Bank 2	Bank 3
5	Bank 3	Bank 4	Bank 5	Kit mode	Bank 1	Bank 2	Bank 3
6	Bank 4	Bank 5	Bank 6	Kit mode	Bank 1	Bank 2	Bank 3

### Zones

It is possible to split the keyboard to up to three zones and assign different voices to each of them. Split points determines the edge notes between two neighbor zones. Relative position of zones and split points are shown below:

Split P	oint 2 Split	Point 1
Zone 3	Zone 2	Zone 1

# Algorithms list

All oscillator variations support 32 Yamaha DX7 and 8 additional KORG opsix <u>algorithms</u>. There are also 45 Yamaha SY77 <u>algorithms</u> supported with feedback count limitation. Several variations support additional user algorithms that can be imported with the online constructor from op6program files. Voice algorithm can be altered with custom parameters.

(3): only single feedback from operator 5 is routed to operator 6

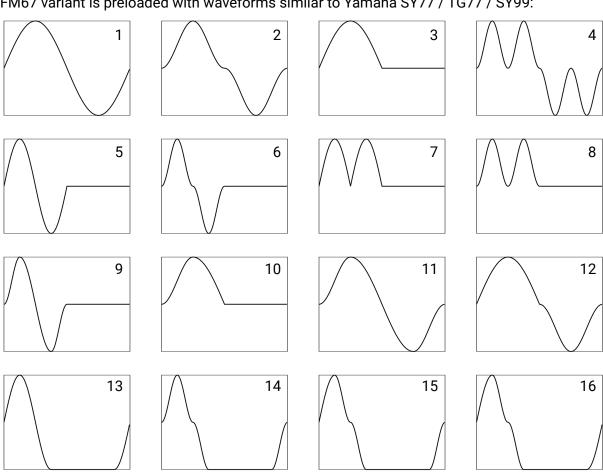

### Waveforms list

Depending on the variation, an oscillator can support more than just one sine wave. Several variations also support waveform customization, that means they can be also altered with the online constructor. Waveforms can be altered with the custom parameters.

FM66 variant is preloaded waveforms similar to Yamaha DX11 / TX81Z:

FM67 variant is preloaded with waveforms similar to Yamaha SY77 / TG77 / SY99:

### Known issues and limitations

- prologue and minilogue XD synthesizers can produce distorted sound or hang when LFO is routed to the Shape. This is due to high CPU utilization of the oscillator and additional CPU load produced by the firmware code for the Shape LFO. To restore normal operation the synthesizer power cycle is needed.
- NTS-1 can produce distorted sound when more than 2 effects are enabled. This is
  due to high CPU utilization of the oscillator and shared CPU architecture of the
  NTS-1. Disable excessive effects to get normal sound from the oscillator.
- On prologue, restoring the assigned parameter value with program recall is only valid
  in case Shape assign is assigned to the Alt (Shift + Shape) due to a parameter
  initialization order of the current firmware. On minilogue XD in opposite, this is the
  only combination that won't restore the value of the assigned parameter.
- Native Yamaha DX / TX series LFO, Amp and pitch modulations are not supported due to performance limitations.
- All ascending EG stages (e.x. typical Attack) are exponential. Implementing the reference semi-linear behaviour will introduce computational complexity that is not currently affordable.

### Q & A

Q: Where to get voice banks?

A: Just search over the Internet for the Yamaha DX7 voice bank files.

Q: I got the voice bank, but the online constructor refuses it / voices sounds bad. What is the correct format?

A: Any VMEM packed voice bank for Yamaha DX1, DX5, DX7, DX7II, DX7s, TX7, TX802, TX816 both in SysEx (4104 bytes) or RAW (4096 bytes) will work. Any other format, including voice banks for Yamaha DX9, DX11, DX21, DX21, DX27s, DX100, TZ81Z will not work.

Q: Does the online constructor collect uploaded banks?

A: All the oscillator customization operations are done in JavaScript of your browser, so no actual upload occurs. Online constructor does not store any data, except for the your browser cookie setting of the last selected synthesizer model.

Q: There is a FM48 custom oscillator available, why is it not covered with this manual?

A: FM48 is oscillator variation for 4-operator Yamaha DX / TX series synthesizer voices. It is still experimental and very inaccurate.

Q: I found the bug / wish to propose a new feature or improvement. How can I report it?

A: Please create a new issue at <a href="mailto:GitHub">GitHub</a> or if you don't have a GitHub account, just send me an email to <a href="mailto:dukesrg@gmail.com">dukesrg@gmail.com</a>.

Q: Is this oscillator free? / Is this an open beta version? / How much will it cost?

A: This oscillator is my hobby, it is and will be free and open source. If you're still itching about using this oscillator for free, you can <u>PayPal me</u> a pint of cider.
